IP Routing: BGP Configuration Guide - Cisco

Chapter Description In This sample chapter from Troubleshooting

BGP: A Practical Guide to Understanding and Troubleshooting BGP, the authors cover BGP Messages and Inter-Router Communication, Basic BGP Configuration for IOS, IOS XR, and NX-OS, IBGP Rules, EBGP Rules, and BGP Route Aggregation

Basic BGP Configuration > BGP Fundamentals | Cisco Press
This module describes the basic tasks to configure a basic Border Gateway Protocol (BGP) network. BGP is an interdomain routing protocol that is designed to provide loop-free routing between organizations. The Cisco IOS implementation of the neighbor and address family commands is explained.

BGP is a standardized exterior gateway protocol (EGP), as opposed to RIP, OSPF, and EIGRP which are interiorgateway protocols (IGP's). BGP Version 4 (BGPv4)is the current standard deployment. BGP is considered a "Path Vector" routing protocol. BGP was not built to route withinan Autonomous System (AS), but rather to route betweenAS's.

Border Gateway Protocol
The BGP, which RFC 1771 defines, allows you to create loop-free interdomain routing between autonomous systems (ASs). An AS is a set of routers under a single technical administration.

Routers in an AS can use multiple Interior Gateway Protocols (IGPs) to exchange routing information inside the AS.

BGP Route Aggregation A router's primary function is to move packets from one network to a different network. A router learns about unattached networks through static configuration or through dynamic routing protocols that distribute network topology information between routers.

BGP communities are an optional transitive BGP attribute that can traverse from autonomous system to autonomous system. A BGP community is a 32-bit number that can be included with a route. A BGP community can be displayed as a full 32-bit number (0-4,294,967,295) or as two 16-bit numbers (0-65535): (0-65535) commonly referred to as new-format.

Border Gateway Protocol (BGP) is a highly scalable dynamic routing protocol that is used to exchange routing information between and within autonomous systems (AS).

BGP - Cisco Meraki

Border Gateway Protocol (BGP) is an Exterior Gateway Protocol (EGP) that allows you to create loop-free interdomain routing between autonomous systems. An autonomous system is a set of routers under a single technical administration. Routers in an autonomous system can use multiple Interior Gateway Protocols (IGPs) to exchange routing information inside the autonomous system and an EGP to route packets outside the autonomous system.

BGP specifies a TCP-based communications method to help autonomous systems exchange routing information over the Internet. An AS is a collection of routers run by a common administration, such as a large enterprise or university, which control a range of IP addresses. Each AS is assigned an Autonomous System Number (ASN).

BGP (Border Gateway Protocol) is the routing protocol of the Internet, used to route traffic from one autonomous system (AS) to another. It's an important topic to understand if you work at an ISP or at a large company that is connected to two or more ISPs.
