This book represents a refreshing and broad view of the nature of allografts, as well as the challenges involved in their use as critical therapy for a variety of different health problems. It is the work of a group of very talented and experienced physicians representing different medical disciplines, but all of them intimately involved with the use of allografts, presenting their distilled experience. The notion of allografts is explored in specialty areas ranging from orthopedics and thoracic surgery to kidney and liver transplantation, in an effort to identify certain common themes having to do with the immunological response to the allograft and the various methods to avoid rejection. Chapters in this book present current challenges in the use of bone allografts in complex orthopedic procedures, in addition to dealing in depth with the use of hepatic and renal allografts in liver and kidney transplantation. Complex issues, such as the role of the immune system trying to deal with allograft acceptance or rejection on the one hand, and the presence of hepatitis B or C infection on the other hand, with the addition of the possibility of coexisting hepatocellular malignancy, are at the core of this book. The authors present the therapeutic problems seen in clinical practice and offer possible solutions, based on their extensive experience. This book will be a valuable resource to scientists involved in disciplines such as transplantation, immunology, and orthopedics, as the themes that are analyzed here cover a broad range of areas.

The Janeway's Immunobiology CD-ROM, Immunobiology Interactive, is included with each book, and can be purchased separately. It contains animations and videos with voiceover narration, as well as the figures from the text for presentation purposes.

The new edition of this valuable clinical resource offers a state of the art, comprehensive review on every clinical condition encountered in pediatric nephrology. International experts present the latest knowledge on epidemiology, diagnosis, management, and prognosis in one concise, clinically focused text, in which care has been taken to couple just the right amount of "need-to-know" basic science with practical clinical guidance that will enable the reader to make efficient, informed decisions. The topics covered include: disorders of renal development, glomerular disorders, the kidney and systemic disease, renal tubular disorders, tubulointerstitial disease, urinary tract disorders, acute kidney injury, hypertension, chronic and end-stage renal disease, and renal replacement therapy. The full-color, highly visual, meticulously crafted format will ensure that the practitioner is able to source and apply information with remarkable ease.

This brilliant synthesis summarizes all of the recent accomplishments — as well as the ongoing research — in the field of composite tissue transplantation. It includes sections on hand transplantation and vascularized bone marrow transplantation. The volume focuses on immunology and the biotechnology/bioengineering aspects of transplantation surgery, as those two areas have demonstrated the most growth within the last five years in terms of current research.

This updated, full-color 4th edition features a greatly expanded surgical focus for a practical guide to corneal surgery. The expert guidance of internationally renowned editors provides you with authoritative and current coverage that takes you from an in-depth exploration corneal function as related to corneal surgery through to the correction of refractive errors. New chapters ensure that you stay up-to-date on the latest developments in the field. This easy-to-use, state-of-the-art resource has been reorganized to focus strictly on surgery to provide you with more coverage of recent surgical advances. Presents boxes of clinical pearls throughout the text for accessible expert guidance. Features the latest surgical techniques and postoperative management of penetrating and lamellar keratoplasty —to provide you with details on hot topics in the field. Gives you fresh insights with new sections and a broader perspective from a new team of editors. Makes use of full color throughout the text, as well as step-by-step surgical line illustrations and full-color photographs so you gain a more accurate visual understanding of corneal surgery. Emphasizes refractive surgery considerations, including technique, with supporting medical illustrations and video presentations.

Brought to you by the world's leading transplant clinicians, Textbook of Organ Transplantation provides a complete and comprehensive overview of modern transplantation in all its complexity, from basic science to gold-standard surgical techniques to post-operative care, and from likely outcomes to considerations for transplant program administration, bioethics and health policy. Beautifully produced in full color throughout, and with over 600 high-quality illustrations, it successfully: Provides a solid overview of what transplant clinicians/surgeons do, and with topics presented in an order that a clinician will encounter them. Presents a holistic look at transplantation, foregrounding the interrelationships between transplant team members and non-surgical clinicians in the subspecialties relevant to pre- and post-operative patient care, such as gastroenterology, nephrology, and cardiology. Offers a focused look at pediatric transplantation, and identifies the ways in which it significantly differs from transplantation in adults. Includes coverage of essential non-clinical topics such as transplant program management and administration; research design and data collection; transplant policy and bioethical issues. Textbook of Organ Transplantation is the market-leading and definitive transplantation reference work, and essential reading for all transplant surgeons, transplant clinicians, program administrators, basic and clinical investigators and any other members of the transplantation team responsible for the clinical management or scientific study of transplant patients.

This book addresses one of the largest unmet needs in transplantation, the need to reduce late allograft loss. In the current era, it is reasonable to expect that most allografts will serve their recipients through their life span and death with preserved graft function the ultimate goal for all transplant recipients. However, long term allograft survival has not paralleled improvements made in short term survival. Each year a percentage of the existing organ transplant patients will lose their grafts. The problem of late allograft failure is due in part to pathogenic processes, to drug management, and to transplant patient care delivery. This book pulls together the science in this area and serves as a resource and as a catalyst for further research. The book has been divided into sections covering the entirety of chronic allograft loss from basic science consideration to clinical implications. The goal of this book is to provide the reader with an overview of long term problems in solid organ transplantation. This overview not only includes the diagnosis of immunologic and non-immunologic causes of chronic graft loss but current management as well as novel therapies for future application. This book will make a useful contribution to the literature.
