There's never been anything like this before: the very first anatomically exact, and complete, three-dimensional, computer-generated reconstruction of actual human anatomy. These amazing color images come to life thanks to the National Library of Medicine's Visible Human Project(TM). For every structure, the database generates an incredibly detailed "wire frame" image, which then underwent contour mapping for a more realistic picture. First, the systemic anatomy appears: the skeletal, muscular, nervous, endocrine, circulatory, respiratory, digestive, urinary, and reproductive systems.

Then, the focus is on the regional anatomy, including the head and neck (with brain, eye, and ear); thorax (with lungs and heart); abdomen (stomach, liver, gallbladder, spleen, intestines, kidney); pelvis; upper limb (arm, elbow, forearm, hand); and lower limb (thigh, knee, legs, and foot). It's the most fascinating mirror on our own construction ever produced, and will enthrall students, doctors, scientists, and anyone interested in the miracle that is the human body.

The only anatomy atlas illustrated by physicians, Atlas of Human Anatomy, 7th edition, brings you world-renowned, exquisitely clear views of the human body with a clinical perspective. In addition to the famous work of Dr. Frank Netter, you'll also find nearly 100 paintings by Dr. Carlos A. G. Machado, one of today's foremost medical illustrators. Together, these two uniquely talented physician-artists highlight the most clinically relevant views of the human body. In addition, more than 50 carefully selected radiologic images help bridge illustrated anatomy to living anatomy as seen in everyday practice. Region-by-region coverage, including Muscle Table appendices at the end of each section. Large, clear illustrations with comprehensive labels not only of major structures, but also of those with important relationships. electronic companion so the printed page stays focused on the illustration. Updates to the 7th Edition - based on reader requests: Full downloadable image bank, now with on/off functionality for individual labels, available at NetterReference.com. New Systems Overview section featuring brand-new, full-body views of surface anatomy, vessels, nerves, and lymphatics. More than 25 new illustrations by Dr. Machado, including the clinically important fascial columns of the neck, deep veins of the leg, hip bursae, and vasculature of the prostate; and difficult-to-visualize areas like the infratemporal fossa. New Clinical Tables at the end of each regional section that focus on structures with high clinical significance. These tables provide quick summaries, organized by body system, and indicate where to best view key structures in the illustrated plates. More than 50 new radiologic images - some completely new views and others using newer imaging tools - have been included based on their ability to assist readers in grasping key elements of gross anatomy. Updated terminology based on the international anatomic standard, Terminologia Anatomica, with common clinical eponyms included. AFTER ten years' preparation the first edition of our Atlas of Human Anatomy was published between 1946 and 1951. Our experience enabled us to improve each of the subsequent editions and the present one has also been thoroughly revised and enlarged to allow the inclusion of more instructive illustrations. Throughout we have adhered to our original intention that this work should be a well proportioned Atlas of life-like illustrations primarily for medical students but also useful to the practising physician and surgeon. The introduction of topographical illustrations in the third volume has been welcomed by readers and, while not embarking on histology, semi-microscopic figures have been introduced into some chapters for a better understanding of function. We did not deviate without reason from the currently accepted methods of

illustrating the elements of the different systems such as bones, joints, muscles, vessels and nerves and we were at pains to base our illustrations on original dissections and to include in them only essential details. The use of colour in the illustrations, introduced by the Italian anatomist Aselli (1627), was with didactic intent. The legends to the illustrations of this edition use the nomenclature of the "Nomina Anatomica", Paris 1955 (PNA) , as revised in New York in 1960.

Imaging Atlas of Human Anatomy, 4th Edition provides a solid foundation for understanding human anatomy. Jamie Weir, Peter Abrahams, Jonathan D. Spratt, and Lonie Salkowski offer a complete and 3-dimensional view of the structures and relationships within the body through a variety of imaging modalities. Over 60% new images—showing cross-sectional views in CT and MRI, nuclear medicine imaging, and more—along with revised legends and labels ensure that you have the best and most up-to-date visual resource. This atlas will widen your applied and clinical knowledge of human anatomy. Features orientation drawings that support your understanding of different views and orientations in images with tables of ossification dates for bone development. Presents the images with number labeling to keep them clean and help with self-testing. Features completely revised legends and labels and over 60% new images—cross-

sectional views in CT and MRI, angiography, ultrasound, fetal anatomy, plain film anatomy, nuclear medicine imaging, and more—with better resolution for the most current anatomical views. Reflects current radiological and anatomical practice through reorganized chapters on the abdomen and pelvis, including a new chapter on cross-sectional imaging. Covers a variety of common and up-to-date modern imaging—including a completely new section on Nuclear Medicine—for a view of living anatomical structures that enhance your artwork and dissection-based comprehension. Includes stills of 3-D images to provide a visual understanding of moving images.

Atlas of Human Body: Central Nervous System and Vascularization is a multidisciplinary approach to the technical coverage of anatomical structures and relationships. It contains surface and 3D dissection images, native and colored cross sectional views made in different planes, MRI comparisons, demonstrations of cranial nerve origins, distribution of blood vessels by dissection, and systematic presentation of arterial distribution from the precapillary level, using the methyl metacrylate injection and subsequent tissue digestion method. Included throughout are late prenatal (fetal) and early postnatal images to contribute to a better understanding of structure/relationship specificity of differentiation at various developmental intervals (conduits, organs, somatic, or branchial derivatives). Each chapter features clinical correlations providing a unique perspective of side-by side comparisons of dissection images, magnetic resonance imaging and computed tomography. Created after many years of professional and scientific cooperation between the authors and their parent institutions, this important resource will serve researchers, students, and doctors in their professional work. Contains over 700 color photos of ideal anatomical preparations and sections of each part of the body that have been prepared, recorded, and processed by the authors Covers existing gaps including
