3 In his text, Kaplan describes different categories of things that behavioral scientists observe. One of those categories, which Kaplan called “observational terms,” is probably the simplest to measure in social science. Observational terms are the sorts of things that we can see with the naked eye simply by looking at them.

Bias. Sometimes scientists don't measure what they are studying but instead measure something closely related to it. Often we do this because it's the only thing we can do, or it's more efficient. Markers & Surrogates. The fact that two things are correlated (follow the same pattern) doesn't mean one causes the other.
