With the introduction of the marginsplot command in Stata 12, visualizing the results of a regression model, even complex models, is a snap. As implied by the name, the marginsplotcommand works in tandem with the marginscommand by plotting (graphing) the results computed by the marginscommand.

linear models. • For nonlinear models, such as logistic regression, the raw coefficients are often not of much interest. What we want to see for interpretation are effects on outcomes such as probabilities (instead of log odds). • Stata has a number of handy commands such as margins, marginsplot, contrast for making sense of regression results and for visualizing such results.

Let's take a look at how to interpret each regression coefficient. Interpreting the Intercept. The intercept term in a regression table tells us the average expected value for the response variable when all of the predictor variables are equal to zero. In this example, the regression coefficient for the intercept is equal to 48.56.This means that for a student who studied for zero hours ...

Statistical regression models estimate the effects of independent variables (IVs, also known as predictors) on dependent variables (DVs, also known as outcomes). At times, we model the modification of the effect of one IV by another IV, often called the moderating variable (MV). This effect modification is known as a statistical interaction.
