Bipartite matching. Can solve via reduction to maximum flow. Flow. During Ford–Fulkerson, all residual capacities and flows are 0–1; flow corresponds to edges in a matching M. Residual graph G M simplifies to: □If (x, y) ∉ M, then (x, y) is in G M. □If (x, y) ∈ M, then (y, x) is in G M. Augmenting path simplifies to:

Companion Website http://www.cs.princeton.edu/~wayne/kleinberg-tardos/. Algorithm Design introduces algorithms by looking at the real-world problems that motivate them. The book teaches students a range of design and analysis techniques for problems that arise in computing applications. The text encourages an understanding of the algorithm design process and an appreciation of the role of algorithms in the broader field of computer science.

A number of problems in relational Artificial Intelligence can be viewed as Stochastic Constraint Optimization Problems (SCOPs). These are constraint optimization problems that involve objectives or constraints with a stochastic component. Building on the recently proposed language SC-ProbLog for modeling SCOPs, we propose a new method for solving these problems. Earlier methods used ...
