Imitation of gestures is held to be the most direct test of the integrity of the executorial stage 3, 19. As the examiner provides a model of the intended movement there is no need to evoke the shape of the movement from long-term memory. Hence, failure on this task could only arise from a defect at the executorial stage.

Psychologist Kenneth Kaye showed that infants' ability to match the sounds or gestures of an adult depends on an interactive process of turn-taking over many successive trials, in which adults' instinctive behavior plays as great a role as that of the infant. These writers assume that evolution would have selected imitative abilities as fit because those who were good at it had a wider arsenal of learned behavior at their disposal, including tool-making and language.
